

Stop Wrong Way

Letter to all the members in the House and assorted others

Dear MP

The House is about to vote on emission control legislation that in view of the prevalence of wind droughts and the lack of grid-scale storage can only make power more expensive and less reliable.

This may be acceptable to the House in the hope of saving the planet but the nation, the people and the environment will pay a bitter price in the short term.

This piece summarises the case against accelerating the flight from coal.

<https://spectator.com.au/2022/07/energy-policy-where-parallel-universes-are-set-to-collide/>

It was rejected by the national daily newspaper which along with the MSM at large has by and large refused to inform the public about the information they need to conduct a useful public debate on energy issues.

The Coalition had also been culpable in going along with the narrative regardless of the facts.

For two years the Energy Realists of Australia have been sending briefing notes to 800+ politicians across the nation to explain the many serious problems caused by allowing subsidised and mandated intermittent energy sources to corrupt and destabilise the grid.

They are collected at this site.

The series is ongoing. The most recent note detailed the lack of grid-scale storage.

You may not have seen them if your support staff decided you did not need to know about them.
